Belgian Club
Superior, Wisconsin

October 28, 2019

6:00 p.m.

1 TRANSCRIPT OF PROCEEDINGS 6:00 P.M.

2 (Discussion off the record.)

3 EXAMINER NEWMARK: Let's get started. The
4 first person we have is Todd Rothe. And we'll show
5 you how this works.

6 TODD ROTHE, PUBLIC WITNESS, DULY SWORN

7 DIRECT TESTIMONIAL STATEMENT

8 BY MR. ROTHE: Todd Rothe spelled T-O-D-D,
9 R-O-T-H-E. And thank you, Your Honor, and
10 Commission for this opportunity to submit my remarks
11 about the NTEC project. I am here to represent over
12 100 local employees that rely on construction
13 projects to support their families. Our jobs are
14 often termed temporary jobs; therefore, they try to
15 negate the importance of these jobs. But the fact
16 is we rely on and support projects such as NTEC to
17 remain employed and to earn a decent living here in
18 Superior, Wisconsin.

19 As we all know and it's obvious to
20 everyone that we live in a modern civilization that
21 depends on electricity, which we're not depending on
22 right now.

23 (Laughter.)

24 MR. ROTHE: So we live in a modern
25 civilization that depends on electricity for daily

1 life. Reliable electricity is an absolute necessity
2 in our region to provide heat for our homes, farms
3 and businesses. So without it people would die. So
4 I am very thankful to utilities such as Minnesota
5 Power and Dairyland Power that are so reliable that
6 we often take them for granted. These utilities are
7 also making tremendous progress by investing in
8 renewable sources of electricity. This plant using
9 very clean burning natural gas is required because
10 renewables do not always provide that reliability
11 that we must have.

12 Everyone would like to reduce our
13 dependence on fossil fuels, and over time technology
14 will continue to help us do that. However, such
15 technology needs to be reliable and economically
16 feasible as well. So progress still needs to be
17 made. The answer is not to simply cut off the
18 supply chain that opponents want to do. Opponents
19 do not offer sensible or practical alternatives to
20 the need. Yet, they support greater reliance on
21 things such as electric vehicles, an obvious
22 conflict. Where is that power going to come from on
23 windless nights here in the dead of winter? Do they
24 suggest we not charge our vehicles to get to work if
25 faced with the choice of whether to heat their home?

1 However, we can also agree then that power won't be
2 shut off if this plant is not built. However, I
3 would argue that it will be supplied at a greater
4 cost, both economically and environmentally.
5 Consumers and businesses will pay more for their
6 power which will be made elsewhere and likely made
7 with more historically proven and reliable methods
8 such as coal.

9 This scenario resembles the opposition to
10 other major infrastructure projects here and across
11 the nation. Opponents themselves rely on this
12 electricity like each of us does to live in a modern
13 society. We all want to plug in our cellphones when
14 we go home tonight, correct? Yet they fight and sue
15 and challenge against the safest, cheapest and most
16 environmentally friendly solutions to have.

17 Please permit the Nemadji Trail Energy
18 Center to be built. Thank you.

19 EXAMINER NEWMARK: Thank you, sir. Thanks
20 for putting up with us. I think this might be
21 working now.

22 (Witness excused.)

23 EXAMINER NEWMARK: Mike French.
24
25

1 MICHAEL FRENCH, PUBLIC WITNESS, DULY SWORN

2 DIRECT TESTIMONIAL STATEMENT

3 BY MR. FRENCH: Good evening. Thank you,
4 Commissioners, for coming to Superior to listen to
5 individual feedback on this Nemadji Trail Energy
6 Center Project. My name is Michael French. I'm a
7 civil engineer with the consulting firm LHB with
8 offices in both Duluth and Superior. I provide
9 engineering design and project management to many of
10 the industrial customers in the greater Twin Ports
11 region.

12 Speaking on behalf of LHB and for myself
13 as a Minnesota Power customer, I fully support the
14 NTEC project for the following reasons. Number one,
15 the preferred site is the ideal location for such a
16 project. It is in the heart of Superior's
17 industrial corridor. There is access to natural gas
18 through existing utility corridors. There is access
19 to electrical transmission lines through existing
20 corridors. The preferred site is currently
21 undeveloped, meaning there is no adverse impact to
22 existing landowners. It is a rare opportunity to
23 undertake a project of this magnitude with a more
24 suitable site.

25 Number two, the project is cooperative.

1 Neither Minnesota Power nor Dairyland Power could
2 take on a project of this scale individually. But
3 together the customers of both can benefit from
4 economies of scale. Our electric grid is
5 cooperative by its very nature. And this is never
6 more true than when it comes to making use of
7 renewable energy. Solar power from fields as far
8 away as Illinois. Wind power from North Dakota.
9 Hydro power from Manitoba. The energy-consuming
10 customers of the Twin Ports all benefit from these
11 renewable resources through cooperation in terms of
12 operation and maintenance of our electrical grid.

13 Number three, and really this is the
14 number one point, closely related to the point above
15 is that this project is all about reliability.
16 While Minnesota Power is absolutely committed to
17 renewable energy, a decade ahead of Minnesota's own
18 renewable standards, it is not a standalone reliable
19 power supply source. There are certain times when
20 elements simply do not work. It may be dark, the
21 wind is not blowing, it's 30 degrees below zero; or
22 there's a storm and a transmission line between here
23 and Manitoba is down or under an outage condition.
24 We still need the traffic lights to work, we still
25 need our houses to be heated. We still need the

1 outlet that powers my grandpa's oxygen generator to
2 work.

3 NTEC will further enable access to
4 renewables by way of providing support for those
5 times when alternate sources of electricity need to
6 be developed and quickly deployed. If we demand
7 electrical power, which we do, we also demand
8 reliability.

9 In conclusion, this is the right project
10 for the right site, it's cooperative in nature,
11 benefitting all the regional power consumers, and it
12 facilitates a continued energy forward shift toward
13 employing more renewables. Thank you.

14 EXAMINER NEWMARK: Thank you, sir.

15 (Witness excused.)

16 EXAMINER NEWMARK: Ben Groeschl.

1 BEN GROESCHL, PUBLIC WITNESS, DULY SWORN

2 DIRECT TESTIMONIAL STATEMENT

3 BY MR. GROESCHL: I thank everybody for
4 coming out tonight. It's a great show of democracy
5 in this country. Everybody here's respectful, and I
6 appreciate that.

7 I'm here today because I'm not against
8 supplying good jobs, good paying jobs, I believe,
9 and fair wages for all. I'm here to bring up
10 counterpoints or alternatives that probably aren't
11 being addressed based on the big dollar amount. But
12 I feel at this time it's crucial that we counteract
13 climate change.

14 Anybody here who ice fishes, which I'm
15 sure is plenty of you, deer hunts, the ice on the
16 lake is forming later and later. There's people
17 falling through on their snowmobiles over and over
18 again in early spring when they shouldn't. As a
19 deer hunter, Wisconsin season, I'm out there in the
20 sleet now with a rain parka on instead of a foot of
21 snow. It's changing. Your grandpa didn't hunt in
22 rain, he just didn't.

23 So a lot of you would get jobs, whether it
24 was wind turbines that went up, solar panels. But
25 today, what I want for the record is to look into

1 different alternatives. So -- and points of
2 interest. So what's the backup power source for
3 this plant? Accidents happen. Let's say a crew's
4 out digging for something else, it could be a power
5 cable. They hit the pipe, it has to be shut down.
6 Takes a week to fix. What happens then? What's the
7 backup power supply?

8 We're in the great white north here. We
9 have a renewable resource, it's called trees. Now,
10 trees do scrub CO2, but there's quality forest
11 management. It will give loggers jobs. And per
12 million Btu, right now for heat, natural gas is up
13 there. It's pretty cost effective. Except for how
14 much longer, five years? Guess what follows that?
15 Wood. So all you got is wood heating paying that
16 logger to deliver 10 cords, guess what, you're doing
17 awesome, you really are. And the new wood stoves
18 come out clean burning, very effective as well.

19 I want to bring up something that is very
20 frowned upon, but there's new technologies. And all
21 of you guys would help build this other plant. And
22 it's called molten salt nuclear reactors. Okay? So
23 instead of water, instead of millions of gallons of
24 water being used to create steam for the turbines,
25 this nuclear reactor stays cool without water. And

1 if all the safety mechanisms go bad, guess what,
2 nothing happens. There's a nuclear reactor of this
3 style that was built in Russia in 2016 that
4 supposedly somehow can run off of the old nuclear
5 waste. So all this that we're stockpiling under
6 mountains can be reused.

7 So I just wanted to bring that to
8 everybody here, you can hop on the internet and do
9 some research. Just look into alternatives. And
10 sometimes, you know, you gotta push the boundaries.
11 You know, it might even cost more. But I really
12 think that that's what we need to do in this
13 critical time and for our children going forward.
14 We gotta start turning things around.

15 So thank you for your time for being here.
16 I appreciate you being here. Some of us didn't have
17 the opportunity to talk to an Administrative Law
18 Judge and offer opinions on other projects in the
19 area. So I am very greatly appreciative of this
20 opportunity. Thank you.

21 EXAMINER NEWMARK: Great. And we're happy
22 to be here.

23 (Witness excused.)

24 EXAMINER NEWMARK: Elizabeth Evans.
25

1 ELIZABETH EVANS, PUBLIC WITNESS, DULY SWORN

2 DIRECT TESTIMONIAL STATEMENT

3 BY MS. EVANS: Hello, my name is Elizabeth
4 Evans. And I am a senior at Superior High School.
5 I live in Superior, Wisconsin, which is where the
6 natural gas plant being proposed by Minnesota Power
7 will be built. Though a natural gas plant may sound
8 like a good thing because it is supposedly natural,
9 that is not the case. The carbon emissions involved
10 with a natural gas plant and the fracking process of
11 retrieving the gas are still going to contribute to
12 the ever-intensifying climate change and will
13 continue to harm the environment.

14 Renewable energy sources are the only
15 answer to reverse climate change and save the earth.
16 On April 26th of last year, there was an explosion
17 at Husky Energy in Superior. This explosion
18 occurred while I was at school with all of my peers.
19 We ended up having to evacuate our school and
20 everyone was terrified, myself included. This day
21 really opened up the eyes for many people by showing
22 them the true dangers that exist alongside
23 nonrenewable energy sources. People began to fear
24 more for their future and truly realized the risks
25 of oils and other nonrenewable resources after this

1 day. I wish the negative attitude toward
2 nonrenewables would have continued to the extent
3 that it did right after that incident because this
4 still holds large problems.

5 The construction of a natural gas line in
6 Superior would involve the burning of gas in my
7 city; and when natural gas is burned, it releases
8 harmful chemicals such as methane and carbon
9 monoxide into the air. This causes air pollution
10 which can lead to health problems due to long-term
11 exposure to these certain chemicals. It is not fair
12 to risk the health of the people in Superior in
13 order to have increased access to energy that could
14 be found just as easily using renewable energy
15 sources such as wind and solar energy.

16 Giving Minnesota Power permission to
17 establish this natural gas plant in Superior would
18 be a terrible mistake that would have a variety of
19 consequences which would all be detrimental to the
20 health of our planet and its people. We are in the
21 middle of a climate crisis and we cannot continue to
22 build more fossil fuels. Instead of taking a step
23 backwards by creating more natural gas plants, let's
24 take a step forward and make a change, a clean
25 change. It's time that we implement the use of

1 renewable energy sources to a greater extent because
2 our future and the future of the earth all lies
3 within the decisions we make right now. Thank you.

4 EXAMINER NEWMARK: Thank you very much.

5 (Witness excused.)

6 EXAMINER NEWMARK: Casey, it looks like
7 Aronson, did I get that right?

8 MR. ARONSON: Yeah.

1 CASEY ARONSON, PUBLIC WITNESS, DULY SWORN

2 DIRECT TESTIMONIAL STATEMENT

3 BY MR. ARONSON: Good evening. My name is
4 Casey Aronson. I reside in Spooner, Wisconsin. I
5 am employed as a business representative for the
6 Operating Engineers Local 139. Our labor
7 organization is a statewide construction union that
8 represents men and women that operate heavy
9 equipment in various industries across the State of
10 Wisconsin. We represent over 10,000 skilled
11 operators and have agreements with over 2,400
12 contractors.

13 I also serve as the vice president of the
14 Northern Wisconsin Building and Construction Trades
15 Council. Our council is comprised of 17 skilled
16 trade unions, and we represent hundreds of members
17 located in northern Wisconsin, many of which reside
18 right here in Superior. We join with business
19 partners, contractors and regulators at the local,
20 state and federal levels to collectively grow
21 northern Wisconsin together.

22 The Northern Wisconsin Building Trades
23 Council and the Operating Engineers Local 139 fully
24 support the proposed NTEC project. The Nemadji
25 Trail Energy Center will be the largest investment

1 in the history of Douglas County. Not only will
2 this project support 260 construction workers and
3 their families for the next four years, but it will
4 also create new tax revenue for the City of Superior
5 and Douglas County. The City of Superior and
6 Douglas County are very fortunate to have energy
7 leading partners with their facilities located right
8 here in Superior. NTEC's proposed power plant would
9 be a perfect fit in the mix. Our energy partners,
10 Dairyland Power and Minnesota Power, have a long
11 history of being very responsible and have proven to
12 be a couple of the energy -- safest energy leaders
13 throughout the midwest. They both value their
14 employees, customers and contractors that build and
15 maintain their facilities. We need partners like
16 this in Superior, because they promote family
17 support in wages, good health insurance and a good
18 retirement, while providing a safe environment for
19 employees of the work.

20 NTEC has committed to a project labor
21 agreement to build this facility. They're making
22 sure that everyone who works on this project will
23 receive the area standard wages and benefits that
24 the union set in this respected area. It also
25 ensures that the highest skilled local craftsmen in

1 the area will be part of building this project.

2 On behalf of the Northern Wisconsin
3 Building and Construction Trades Council and the
4 Operating Engineers Local 139, we fully support the
5 proposed NTEC project. Thank you for your time and
6 listening to my recommendation on this proposed
7 project.

8 EXAMINER NEWMARK: Thank you.

9 (Witness excused.)

10 EXAMINER NEWMARK: Pastor Bridget Jones.

1 PASTOR BRIDGET JONES, PUBLIC WITNESS, DULY SWORN

2 DIRECT TESTIMONIAL STATEMENT

3 BY PASTOR JONES: Hi. I'm Pastor Bridget
4 Jones from Superior, Wisconsin; and I am so grateful
5 for the chance to speak about this project. I'm
6 here to ask the Wisconsin Public Service Commission
7 to oppose the Nemadji Trail Energy Center so that
8 ratepayers and citizens are not stuck with a
9 stranded asset that is built with the past in mind
10 instead of the future.

11 The seminary where I earned my degree is
12 really struggling right now. It was built in the
13 '60s in the style of brutalism, which means it is a
14 very ugly building that is all exposed concrete and
15 glass. It is also so expensive to heat and cool and
16 illuminate. And many people are asking what on
17 earth were they thinking when they built this? But
18 it's not their fault. They were thinking that
19 nuclear power was on the horizon and energy was
20 going to be so cheap.

21 It just turns out that that didn't happen,
22 and now we are stuck with a building that was built
23 for a future that did not materialize. If they had
24 known then the struggle we would have later, they
25 would have planned differently. If they could have

1 seen the future, they would have made a different
2 choice.

3 We right here, right now in Superior are
4 in a much better position than my seminary was. We
5 can already see how the future will be different.
6 We already see how the cost of renewables continues
7 to fall to the point that new renewable
8 installations are already more cost effective than
9 running some fossil fuel plants, and that the cost
10 of battery storage falls as its efficacy grows. We
11 can already see the effects of climate change, of
12 stronger storms, higher sea levels and warmer
13 temperatures. And we know that we will have to take
14 decisive action. We don't know what that looks
15 like, but we can bet that we will have solutions
16 that will require us to burn significantly fewer
17 fossil fuels. We can already see how consumers will
18 become more aware of their impact on the earth and
19 demand better. More than six million people
20 participated in the climate strikes in September as
21 people all around the world demanded action to fight
22 climate change. We can already see how natural gas
23 is neither clean nor safe and it is actively harming
24 the environment when it is extracted from the earth.
25 We can already measure how natural gas is harming

1 the environment when it is transported. So we
2 already know that the Nemadji Trail Energy Center
3 will be a bad idea. We already know that this
4 project is an investment in the past when we need
5 investment in the future.

6 Other utilities and regulators can see the
7 writing on the wall. In April this year, regulators
8 denied veterans' plans to build a gas plant in
9 Indiana citing lower consumer demands and lower cost
10 of renewables. Utilities across the United States
11 are changing their integrative resource plans to
12 take into account the increased role of renewables
13 and storage and decreased energy demand.

14 I ask that the Wisconsin Public Service
15 Commission would join these other regulators in
16 opposing new fossil fuel projects and oppose an
17 Nemadji Trail Energy Center, a stranded asset in the
18 making. Thank you.

19 EXAMINER NEWMARK: Thank you, ma'am.

20 (Witness excused.)

21 EXAMINER NEWMARK: Derek Pederson.
22
23
24
25

1 DEREK PEDERSON, PUBLIC WITNESS, DULY SWORN

2 DIRECT TESTIMONIAL STATEMENT

3 BY MR. PEDERSON: Thank you, Your Honor.

4 Good morning, my name is Derek Pederson, and I'm
5 with the Labors Union Local 1081 and a customer of
6 the utility of Minnesota Power. I am here tonight
7 to support the Nemadji Trail Energy Center. Grid
8 stabilization is something we as consumers take for
9 granted. But this is something power companies have
10 to work on every day to supply the reliable power we
11 need in our lives. This plant would bring the
12 stabilization we need to the area and the
13 reliability I have grown to be accustomed to from my
14 home supplier, Minnesota Power. To move forward in
15 the quest for renewables, this plant is a must for
16 the highs and lows of wind and solar energy. It
17 will be the most technologically advanced, most
18 efficient plant of its kind. NTEC will be 65
19 percent less carbon intensive and emit no mercury at
20 all.

21 I'm going to leave with the question we
22 should be asking ourselves. Would any company spend
23 upwards of \$700 million for something that is not a
24 crucial part of the infrastructure we need moving
25 forward to clean and reliable energy? Thank you.

EXAMINER NEWMARK: Thanks.

(Witness excused.)

EXAMINER NEWMARK: Okay. Kirk Ilenda.
And then Kyle Bukovich and Taylor Pedersen and Tom
Selinski.

1 KIRK ILEND, PUBLIC WITNESS, DULY SWORN

2 DIRECT TESTIMONIAL STATEMENT

3 BY MR. ILEND: My name is Kirk Ilenda. I
4 live at 3913 North 21st Street in Superior,
5 Wisconsin, where I have been a resident here for 30
6 years. Also, I work in Superior as director of
7 business development for Lakehead Constructors, an
8 area general contractor, and we've been here in
9 Superior for 103 years.

10 I'm here today to testify and make
11 comments in support of the Nemadji Trail Energy
12 Center project, for two various reasons I came up
13 with. One is support for the environment, and then
14 second is for the economics and employment. Both
15 Minnesota Power and Dairyland are good stewards of
16 our environment and creating good, solid future
17 electrical generation plans to include a lot of
18 wind, solar and hydro. However, for their renewable
19 energy plans to be effective, they need to also
20 build a reliable flexible backup source of
21 electricity for when the wind isn't blowing and the
22 sun is not out on a day much like today.

23 Using natural gas as a fuel source is a
24 solution for this. It provides reliable, cleaner
25 alternatives to coal generation, 65 percent lower

1 carbon emissions and emits no mercury. Our region
2 needs reliable 24/7 electricity to run our
3 hospitals, our schools, places of business, the big
4 industry like our refinery, pipelines and mills, and
5 importantly our homes.

6 It's also about the economics and the
7 employment. Here at Superior, I say why not us,
8 this is an incredible opportunity for a large
9 projects. We see it all over the region. Rarely
10 does it happen in our own backyard. Folks, this is
11 a \$700 million opportunity, one of the largest
12 private investments in Superior and in Douglas
13 County. It will create 260 construction jobs for my
14 friends in the construction industry. These are men
15 and women, craftspeople that work hard and they need
16 to make a good living wage. This allows them that
17 opportunity. It's about the 25 permanent jobs
18 created here in Superior. Also importantly, it's
19 our opportunity for regional electrical independence
20 here in northwestern Wisconsin. It's for our
21 residents and all of our employers. Also, it's
22 \$1 million that will be annually paid to both the
23 City of Superior and Douglas County.

24 So with both Minnesota Power and Dairyland
25 developing this plant to move their renewable energy

1 plan forward, build a state-of-the-art plant that
2 increases the reliability and the flexibility for
3 the jobs, and economic benefits it provides in my
4 hometown of Superior, I support approving the
5 certificate of need for the Nemadji Trail Energy
6 Center. Thank you.

7 EXAMINER NEWMARK: Thanks.

8 (Witness excused.)

9 EXAMINER NEWMARK: Kyle Bukovich.

1 KYLE BUKOVICH, PUBLIC WITNESS, DULY SWORN

2 DIRECT TESTIMONIAL STATEMENT

3 BY MR. BUKOVICH: Good evening. My name
4 is Kyle Bukovich. I'm the president of the Northern
5 Wisconsin Building and Construction Trades Council.
6 I am also the assistant business manager and
7 president of International Brotherhood of Electrical
8 Workers Local 242 and a Douglas County resident for
9 32 years.

10 The Northern Wisconsin Building Trades and
11 IBEW Local 242 fully supports the Nemadji Trail
12 Energy Center. NTEC will create up to 260
13 family-sustaining construction jobs for three years.
14 They will also create up to 25 full-time positions,
15 as well as an additional 150 indirect jobs. NTEC
16 will be the largest private investment in the
17 history of Douglas County at \$700 million and will
18 invest \$1 billion in the region over 20 years.
19 Douglas County and the City of Superior will share
20 \$1 million in revenue annually for hosting the
21 facility.

22 NTEC is crucial in reducing carbon
23 emissions while supporting renewable resources by
24 providing flexibility and maintaining reliability by
25 running when the sun doesn't shine and the wind

1 blow. Minnesota Power has committed to utilizing
2 the highest quality and safest workforce available.
3 That workforce are the residents of the City of
4 Superior, Douglas County and the surrounding
5 communities.

6 Also, as a resident of Douglas County, I
7 fully support the proposed Nemadji Trail Energy
8 Center. Thank you.

9 EXAMINER NEWMARK: Thank you, sir.

10 (Witness excused.)

11 EXAMINER NEWMARK: Taylor Pedersen.

1 TAYLOR PEDERSEN, PUBLIC WITNESS, DULY SWORN

2 DIRECT TESTIMONIAL STATEMENT

3 BY MR. PEDERSEN: Thank you, Your Honor.
4 Good evening. My name is Taylor Pedersen. I'm the
5 president and CEO of the Superior-Douglas County
6 Area Chamber of Commerce. On behalf of the
7 Superior-Douglas County Area Chamber of Commerce,
8 its board of directors and nearly 400 members, I'm
9 here today in support of the Nemadji Trail Energy
10 Center, NTEC, and to ask you for your support in the
11 application process.

12 The design and construction of NTEC has
13 the potential to be the most significant development
14 in Superior and Douglas County history. The project
15 would not only have a significant investment during
16 construction, but the project would contribute
17 approximately \$1 million in much-needed annual
18 revenue for the city and county in which it would be
19 located.

20 Minnesota Power and Dairyland Power
21 Cooperative are not only two outstanding companies,
22 but they are good neighbors and they are
23 organizations that care about those that they employ
24 and those that they serve. Both organizations
25 directly and indirectly support hundreds of

1 businesses and numerous community organizations each
2 year. By supporting this project, the Public
3 Service Commission of Wisconsin is supporting all of
4 these businesses and citizens that rely on the
5 impact of these companies each day.

6 Our Chamber of Commerce has been very
7 impressed with the ongoing public outreach of this
8 project to date, willingness to educate the public,
9 and demonstration of transparency to local
10 government, citizens and stakeholder groups. The
11 region needs this project to continue and improve
12 the positive impact these companies will have on our
13 community. Further, this process would allow the
14 construction of the facility that is 65 percent less
15 carbon intensive than traditional generating
16 facilities, which is a significantly better
17 alternative. This will add additional jobs to our
18 economy as well as increase power reliability
19 through the grid stabilization.

20 We encourage the Public Service Commission
21 of Wisconsin to support the NTEC project and
22 application process. Thank you for your time and
23 the opportunity to comment.

24 EXAMINER NEWMARK: Okay. Thank you, sir.

25 (Witness excused.)

EXAMINER NEWMARK: All right. Tom
Selinski.

1 TOM SELINSKI, PUBLIC WITNESS, DULY SWORN

2 DIRECT TESTIMONIAL STATEMENT

3 BY MR. SELINSKI: Good afternoon. My name
4 is Tom Selinski. I just found out about this at the
5 last minute, but I decided to stop by. Just to give
6 you my background, I live at 1730 Minnesota Avenue
7 in Duluth. I spend a lot of my time working in
8 Wisconsin. But I just want to let you know about my
9 background. My background has been almost 40 years
10 in the power industry. I have worked on every type
11 of power plant that is really in existence. Coal,
12 nuclear, gas, wood chips, wood waste, you name it.
13 And so I have a fairly good -- or a passing
14 knowledge of those industries. And one of the
15 things is all those power plants have one thing in
16 common, they are not intermittent power. Unless
17 something majorly goes wrong with them, they do
18 not -- they will rarely not be producing power.

19 If you look at Altamont Pass in
20 California, you can drive through there on the wrong
21 day and you see 1,700 windmills just standing still.
22 Okay? What we're talking about tonight is that you
23 cannot have that in the modern age. I think, you
24 know, 80 years ago or whatever, people could all
25 just stay home. You can't have intermittent power.

1 And so this type of power plant that
2 they're proposing is a -- you know, is a good
3 solution for where we're at today. We do not have a
4 lot of alternatives. Batteries are really pie in
5 the sky. Pump storage, that would be a better way
6 to go, but there's only really one known pump
7 storage plant that's for peaking power, and that's
8 in Bare Mountain in Massachusetts; and I have
9 friends of mine -- I was working out there -- that
10 have worked on that.

11 So we don't have -- you know, we really
12 need to have a system to back this up. You know,
13 wind power, I'm not against any of this. What I'm
14 saying is that if you're going to have those, you're
15 going to have to have something that's dependable.
16 And they just aren't that dependable. And so you
17 have to have this system.

18 A coal-fired system like the ones proposed
19 in Superior is a good stopgap that -- everything in
20 life is a stopgap until the next invention comes
21 along that is better than the last one. And so I
22 definitely support this. Yeah, I think that's about
23 it. But I think it's a very good idea. Because an
24 example, a nuclear power plant, 2,700 turbine --
25 wind turbines it takes to generate the power of a

1 power plant. Or -- and gas-fired power plant or
2 coal-fired power plant. 2,700. And so the scale of
3 this thing is incredible that we're going into. And
4 so we need this type of plant to give us dependable
5 power in between when we have problems. Thank you.

6 EXAMINER NEWMARK: Thanks, sir.

7 (Witness excused.)

8 EXAMINER NEWMARK: Tom Lyden.

1 TOM LYDEN, PUBLIC WITNESS, DULY SWORN

2 DIRECT TESTIMONIAL STATEMENT

3 BY MR. LYDEN: Hi, my name is Tom Lyden.
4 I'm with Hunt Electric in Duluth, Minnesota. Hunt
5 Electric and Minnesota Power have been working
6 together on projects for more than 25 years. From
7 reducing emissions at the thermal generation
8 facilities and modernizing hydro facilities to
9 building renewable wind and solar farms in northern
10 Minnesota. Throughout that time, Minnesota Power
11 has proven to be a great corporate and civic-minded
12 partner.

13 As you know, NTEC is a proposed 550
14 megawatt natural gas power plant at a shovel-ready
15 industrial site in Superior. This would provide
16 Superior and Douglas County with \$1 million in
17 annual revenue and 260 construction jobs as well as
18 25 permanent jobs.

19 The fact that Minnesota Power met the
20 Minnesota state renewable energy standard of 25
21 percent renewable energy by 2025 in the year 2015, a
22 full decade early, should not be a surprise.
23 Minnesota Power plans to be 50 percent renewable by
24 2021, and NTEC supports these renewable resources by
25 providing flexible and reliable power when the sun

1 is not shining or the wind is not blowing. When
2 compared to traditional thermal generation
3 facilities, NTEC will be quiet, it will be 65
4 percent less carbon intensive, while producing no
5 mercury at all.

6 The fact that Minnesota Power and
7 Dairyland Power Cooperative are partners in NTEC
8 shows what good economic stewards both companies are
9 as they can provide clean, reliable power to both
10 northern Minnesota and northwestern Wisconsin while
11 allowing the customers the benefit of the economies
12 of scale.

13 We support approving the certificate of
14 need for the Nemadji Trail Energy Center. Thank you
15 for your time.

16 EXAMINER NEWMARK: All right. Thank you,
17 sir.

18 (Witness excused.)

19 EXAMINER NEWMARK: We have Keith Allen.
20
21
22
23
24
25

1 KEITH ALLEN, PUBLIC WITNESS, DULY SWORN

2 DIRECT TESTIMONIAL STATEMENT

3 BY MR. ALLEN: My name is Keith Allen. I
4 live in Itasca, about a mile from here. And it's
5 about two miles from the power plant. I've been a
6 resident of the City of Superior for 64 years, lived
7 in Itasca since 1977, been elected to the Douglas
8 County board since 1988, which represents Allouez
9 and Itasca and part of South Superior. I'm on the
10 development association since about 2014, which the
11 development association supports this project.

12 First of all, I'd like to say I fully
13 support this project. It needs to go forward to
14 start the first phase of green energy, I believe.
15 We all know the wind doesn't shine, the sun
16 doesn't -- I got it backwards. We all know -- I
17 guess it's my comedy time. The wind doesn't blow,
18 the sun doesn't shine. That's why -- and we all
19 need constant energy. It's like when you build a
20 road. There are peaks and valleys, you have to
21 build bridges and take the peaks down a little bit
22 to have a constant line. We need to have that
23 constant line with this green renewable energy
24 because it's not consistent.

25 This location is perfect for the Superior

1 project. I would like to see it passed. I don't
2 think it should be rubber stamped. That's why we're
3 here tonight as part of the checks and balances of
4 the system. Again, I just fully support the
5 project, and thank you for your time.

6 EXAMINER NEWMARK: Thank you; sir.

7 (Witness excused.)

8 EXAMINER NEWMARK: Tom Galuzen.

1 TOM GALUZEN, PUBLIC WITNESS, DULY AFFIRMED

2 DIRECT TESTIMONIAL STATEMENT

3 BY MR. GALUZEN: Thank you, Hearing
4 Examiner, for the correct pronunciation of my name.
5 I don't know how that happened.

6 EXAMINER NEWMARK: Me either.

7 MR. GALUZEN: Okay. I'm here in
8 opposition to this proposed project. I've lived in
9 Bayfield, Wisconsin, northern Wisconsin resident all
10 my life and I'm a farmer. I've been farming for
11 more years than I want to even count. A market farm
12 by Bayfield. And a lot of people from this area
13 come to the farm, and we ship boxes of fruits and
14 vegetables here to Superior and Duluth, and also
15 there's a couple stores up here with some of our
16 products.

17 My educational background is in typical
18 science and environmental geography; and that was
19 back in time, of course, at UW-Eau Claire. But
20 while I was there, I got involved in the project --
21 opposing a project, that being the Tyrone Nuclear
22 Power Plant that was proposed for Durand, close to
23 Eau Claire, about 20 miles downstream. And after
24 they perfected that, the Public Service Commission
25 smartly refused to issue a certificate of -- is it

1 called convenience and need or convenience and
2 necessity, and the plant was not built. And reports
3 came out a few years later indicating that, as we
4 had maintained, there was not a need for the
5 project. And, actually, there was quite a savings
6 to the ratepayers by not building that project. And
7 maybe some of stock may have lost some money, but
8 that's another story.

9 So here we sit many, many years later, our
10 organization at that point analyzed things and
11 thought that, well, what we need in this country is
12 zero energy growth. And I think that has come to
13 the forefront again. If you walk outside or spend a
14 little bit of time outside or maybe even run to the
15 car from the building, you'll notice the climate's
16 changing and dramatically so. This has been a tough
17 year for agriculture. I always kind of feel it's a
18 tough year for agriculture being involved in it.
19 But if you read the news reports on it and
20 government statistics, there are millions of acres
21 in the midwest that were not planted with corn and
22 soybeans. Now, I'm not predisposed to corn and
23 soybeans much myself, but it's an indication of
24 something wrong with our climate and something could
25 be drastically wrong with our food system in the

1 future in terms of supply of what we currently are
2 using and growing.

3 This fall, reports show that in Wisconsin,
4 farmers are somewhere between two and three weeks
5 behind on the stage for corn and soybeans being
6 harvested. And our own experience has been too much
7 rain in the spring, too much drought in the middle
8 of the summer, and too much rain, you know, in the
9 fall. These are abnormal times. Five of the seven
10 days in several of these weeks have been really
11 unsuitable for farming activities, except for
12 running from shed to shed or going outside and being
13 drenched in the cold rain and going inside and
14 warming up by the wood stove.

15 If you look at the news reports over time,
16 and I don't have the thick file along with me that I
17 have at home, no one would want to listen me to read
18 or recount it all, but the United Nations panel on
19 climate change, was it about a year ago now, said,
20 well, maybe we got 10, maybe we got 12 years in
21 which time things should significantly change around
22 in terms of our releases of climate-altering
23 emissions.

24 And so if we build this plant, by the time
25 it's built, we'll be about halfway through that 10

1 to 12 years; and at that point, we should be
2 removing, actually, that amount of demand from our
3 system through alternative energy, through
4 efficiency, through changes in our production
5 processes. I mean, there's many, many options out
6 there.

7 I have been off grid since 1982. Okay?
8 And that's a long time. And right now I've got four
9 freezers plugged in, and I'm on solar and wind. And
10 I'll probably use a little Honda generator tonight.
11 But I betcha 95 percent of my electricity comes from
12 solar and wind. And that wind generator that was
13 originally put in in 1983 was manufactured in Duluth
14 by Rural Power Technologies, Duluth. The Twin Ports
15 own brilliant scientist who went to MIT, one Elliott
16 Bailey, if anybody who knew him. But over the years
17 I've learned a lot about batteries and I've learned
18 a lot about what seems to be from a non-climate
19 change -- or an anti-climate change or a pro-Earth
20 standpoint, but seems to be a response. I got
21 myself in a tough situation because we grow a lot of
22 crops that we freeze and then make jams with and
23 sauces with that are sold later in the year. And,
24 you know, I think about it daily, particularly when
25 there's not enough sunshine when there usually is

1 and not enough wind when there usually is. And, you
2 know, I'm always looking for ways in which I can
3 improve my efficiency, alter my practices and reduce
4 my demand. And I think that's a parable for society
5 and a parable for all the institutions that are
6 involved in society. And I hope that the Commission
7 will consider those comments and other comments
8 dealing with groundwater, et cetera, which you're
9 going to hear in the sworn testimony and also
10 tonight in the public testimony. Thanks for the
11 opportunity to come.

12 EXAMINER NEWMARK: Appreciate it. Thank
13 you.

14 MR. GALUZEN: And pronouncing my name
15 correctly.

16 EXAMINER NEWMARK: Okay. Well, I'm not
17 going to attempt it again because I guess I did it
18 right the first time.

19 (Witness excused.)

20 EXAMINER NEWMARK: Jacob Meador.
21
22
23
24
25

1 JACOB MEADOR, PUBLIC WITNESS, DULY SWORN

2 DIRECT TESTIMONIAL STATEMENT

3 BY MR. MEADOR: Hello, my name's Jake
4 Meador; and, I'm sorry, I have nothing scripted
5 tonight. But I just wanted to give you just kind of
6 my side of the story on this. Quick background, I
7 was raised in Superior, I went to school here, I
8 graduated here. I went in the military afterwards
9 right after high school. And I came back because I
10 wanted a family. And I came back and the work
11 wasn't here. So I had to displace my family several
12 times, follow jobs, travel, travel, travel. And it
13 was no fun life for my kids.

14 Then due to unplanned circumstances, I
15 became a single father of three, with full custody
16 of all three. I came back and I joined a skilled
17 trade. I joined the carpenters union. And since
18 that day, they have kept me in work here in my
19 community; and my children have been in the same
20 school for the last several years. And I cannot
21 stress to you how important it is to be proud to
22 have a livable wage to be able to raise a nice young
23 family in the community that I grew up in.

24 I need this job, and I know there's
25 hundreds, if not thousands of other brothers and

1 sisters in the skilled trade in this community, in
2 the greater Twin Ports region, that need this
3 project to go forward. This community needs this
4 project to go forward to build a better life for all
5 of our families. Thank you.

6 EXAMINER NEWMARK: All right. Thank you,
7 sir.

8 (Witness excused.)

9 EXAMINER NEWMARK: Amy Wilson.

1 AMY WILSON, PUBLIC WITNESS, DULY SWORN

2 DIRECT TESTIMONIAL STATEMENT

3 BY MS. WILSON: Hello. My name is Amy
4 Wilson, and I'm from Orienta in northern Wisconsin.
5 I've put my speech into three places: problems,
6 solution and choice. The problem. The hour is
7 late. We know beyond a shadow of a doubts that we
8 have loaded our climate with greenhouse gases from
9 the burning of fossil fuels, causing increased
10 storms, floods, droughts, forest fires, instability,
11 pain, suffering, and the loss of life to more than
12 just the human population. Climate chaos is
13 affecting plants, animals and all life forms.
14 Climate chaos is accelerating the sixth mass
15 extinction.

16 Our solution. The solution to this
17 problem is right here and accessible right now.
18 Currently, wind and solar -- wind storage is cheaper
19 than any fossil fuel options, including the natural
20 gas plant proposed here. By investing in renewable
21 energy with storage, we will have energy that costs
22 less than this natural gas plant. We will not have
23 stranded assets that our society will be burdened
24 with. We will be making steps towards our goal of
25 backing off of the burning of fossil fuels set by

1 the inter-governmental panel on climate change and
2 advanced by the -- and the events of the climate
3 scientists.

4 We will be protecting our precious water
5 and air, reducing health concerns such as asthma,
6 strokes, and heart and lung problems. We will be
7 creating more good jobs and a future that our young
8 people can rely on. Currently, solar and wind with
9 the storage makes more jobs than pipelines and power
10 plants. We can give jobs to everybody. I used to
11 be a solar installer, and I don't -- I no longer do
12 that. So, seriously, there are more jobs with solar
13 and wind.

14 The choice. The choice is between an
15 antique failed energy system that is destroying the
16 future and today's healthy, progressive solar and
17 wind energy systems that do not threaten our water,
18 air and future.

19 Dear Public Service Commission people,
20 please do not choose to approve the Nemadji Trail
21 Energy Center. Please join us and the growing
22 movement to make our world safer today and for
23 future generations. Be a part of the solution to
24 move beyond fossil fuels.

25 I've lived for 30 years off of the grid,

1 and I helped design and build a solar greenhouse
2 that heats itself year-round in northern Wisconsin.
3 I have been part of a company that my partner and I
4 started, and I have seen solar grow up from infancy,
5 through all the trials and tribulations, to it being
6 a successful industry. And solar and wind with the
7 backup of energy size storage is the answer. And it
8 makes more jobs and it gives our children a future.
9 And it makes it so that we are -- have a healthier
10 environment. And it doesn't use that copious amount
11 of water that even the DNR is concerned about this
12 plant taking.

13 So thank you very much. Thank you for the
14 Commission, and here's my testimony.

15 EXAMINER NEWMARK: Okay. Great. Thank
16 you, ma'am.

17 (Witness excused.)

18 EXAMINER NEWMARK: Chris LaForge.
19
20
21
22
23
24
25

1 CHRIS LAFORGE, PUBLIC WITNESS, DULY SWORN

2 DIRECT TESTIMONIAL STATEMENT

3 BY MR. LAFORGE: Thank you for this
4 opportunity to provide testimony on the proposed
5 Nemadji Trail Energy Center. My name is Christopher
6 LaForge. I am a master trainer certified by the
7 Interstate Renewable Energy Council in the area of
8 photovoltaic technologies. Put simply, solar power.
9 And I've run Great Northern Solar for the last 30
10 years and we've worked to improve the energy
11 paradigm each of those years.

12 I'm a native of Duluth. I've lived in
13 this region almost my entire life. I live on the
14 south shore of the Lake Superior watershed. And I'm
15 very happy to see all my brothers and sisters from
16 the unions out today. Thank you for your honest
17 testimony.

18 I am a retired member of IBEW 242. I got
19 a smile for that. I've trained union electricians
20 in the area of solar energy, and I prefer to train
21 union electricians.

22 I am not testifying in favor of this
23 plant. My job in the last 25 years has been to
24 teach the alternative. Lately, I've been hired to
25 train utility engineers, contractors and

1 administrators in the latest current technology.
2 This is not the future. This is the present.
3 Large-scale energy storage, utility-scale energy
4 storage coupled with wind and solar generation is
5 now the lowest cost form of generation. So although
6 I am here because my heart is with those people who
7 might have their native lands disturbed by a plant
8 that is evidently in an unoccupied zone, it has been
9 occupied and it continues to be occupied.

10 Full disclosure. I am a shareholder of
11 Minnesota Power through the elite parent
12 corporation. And although I know my utility is
13 doing some progressive things, I also know that
14 utilities are very slow to adapt. That's why
15 tonight I'm going to talk about stranded resources
16 leading to stranded assets. This is a present
17 concern.

18 The portfolio of fossil fuel resources
19 represents a \$121 trillion set of stranded
20 resources. Putting the required halt to their use
21 to stave off greater climate catastrophe represents
22 an economic challenge that the International
23 Monetary Fund and the World Bank are currently
24 stymied with. Even without climate concern,
25 investment in any new fossil fuel asset is dubious

1 at best. Renewable energy resources combined with
2 large-scale energy storage is currently the lower
3 cost alternative. I'm going to cite some other
4 stats.

5 Forbes Magazine, a business magazine,
6 quote, The cost of renewable energy has tumbled even
7 further over the past year --

8 EXAMINER NEWMARK: Slow down.

9 MR. LAFORGE: If I don't talk fast, these
10 people are going to get tired of me. It's going to
11 be turned in in written format, so you don't have to
12 get it that way.

13 EXAMINER NEWMARK: Off the record.

14 (Discussion off the record.)

15 MR. LAFORGE: So Forbes Magazine states,
16 quote, the cost of renewable energy -- and this is
17 May 2019. The cost of renewable energy has tumbled
18 even further over the past year to the point where
19 almost every source of green energy can now compete
20 with the cost of oil-, coal- and gas-fired plants.

21 As a shareholder, I raised this issue with
22 my utility, Minnesota Power, at the annual
23 shareholders meeting this year. My CEO and board of
24 directors are ignoring the facts of today's real
25 energy market costs. Solar plus storage offers the

1 lowest cost. From a recent report published in Wood
2 Mackenzie Power & Renewables, low cost nuclear, low
3 cost nuclear comes in at \$102 per megawatt-hour; low
4 cost coal, \$56 per megawatt-hour; low cost combined
5 cycle gas turbines, that's this plant, low cost \$34
6 a megawatt-hour. Low cost solar plus storage is
7 less than \$27 a megawatt-hour, and that data is from
8 June of 2018. It is lower today.

9 The rise of electromobility and demand for
10 stationary storage will drive the lithium-ion
11 battery costs down another 50 percent by 2040.
12 That's according to Bloomberg's New Energy Finance's
13 latest report on the outlook for solar plus storage.
14 The costs for the technology have already tumbled 85
15 percent from 2010 to 2018. Business intelligence
16 firms predict that somewhere between one and 2.8
17 terawatt-hours of storage is going to be installed
18 in the next 21-year time.

19 I'm going to hand this testimony in, it
20 shows more purchase agreements, power purchase
21 agreements, that show that \$27 a megawatt-hour is a
22 little bit high. It's actually gone under \$20 per
23 megawatt-hour.

24 Okay. Recent news that we can read shows
25 the urgency that this issue presents. From a

1 utility insider magazine that's online called
2 Utility Dive, you can look it up, Catherine
3 Morehouse wrote in September of 2019: Renewables,
4 storage poised to undercut natural gas prices and
5 increase stranded assets. If all the proposed gas
6 plants get built, 70 percent of those investments
7 will be rendered uneconomic by no later than 2035.
8 The Rocky Mountain Institute, which has done some of
9 the cutting edge research on all of our
10 technologies, says carbon free resources are now
11 cost competitive with new natural gas plants. In
12 fact, solar and storage installed now costs less
13 than operating an existing natural gas plant.

14 I've been telling my conservative friends
15 for decades let's look at it, the fuel is free.
16 Methane, the natural gas we produce with fracking
17 technologies, destroys four million gallons of
18 potable water with each fracked well. That's an
19 unseen cost. That's an externality. Methane that
20 escapes in the fracking technology has proven to
21 create more greenhouse gases when totaled with the
22 burning of it than coal-fired power plants. Natural
23 gas is not clean. Wind, solar and storage projects
24 combined with this demand-side management, what my
25 friend Tom was talking about, working with the loads

1 at a utility scale, have reached a tipping point,
2 meaning that they're now able to compete and
3 out-compete natural gas with the same reliability of
4 service. But unlike fluctuating price fuels, these
5 technologies prices are going to drop.

6 The reality is that we will leave many
7 natural gas investors and utilities with stranded
8 infrastructure assets, and we must make any
9 investments in fossil fuels with a great deal of
10 caution.

11 A second story is pertinent, especially to
12 our Public Service Commission. From the same
13 utility rag, Utility Dive, October 1st, 2019, quote:
14 Minnesota -- and that's -- Minnesota rejects Xcel's
15 720 megawatt Mankato gas plant purchase over
16 stranded asset concerns.

17 So the Minnesota equivalent of the PSC
18 denied Xcel their opportunity to buy into an
19 existing plant, which would cost less than building
20 a new one, because of the concerns that it would
21 have to close early leaving customers, ratepayers,
22 with hundreds of millions of dollars in stranded
23 costs. That was October 1st.

24 As utilities transition to a less carbon
25 intensive grid, many see natural gas investments as

1 a logical transition from increasingly expensive
2 coal-fired power. But some stakeholders are now
3 worried that coal-to-gas transition will leave
4 utilities and investors with stranded assets as our
5 renewable and storage prices drop to record low.
6 Clearly -- now, that's all the quote from that
7 article. Now this is me. Clearly, today's real
8 energy market portends that any investment in new
9 fossil fuel assets will be doomed to be stranded and
10 creating a huge loss for the investors, the public,
11 the ratepayers and our future.

12 This \$700 million spending plan is
13 currently a boondoggle of tremendous proportions
14 without any concern for the climate, local water
15 resources, tribal community rights, the known
16 hazards of fracking technology, and any hope for our
17 collective future. You don't have to worry about
18 any of that. This is a bad investment just on the
19 economics.

20 We need to create good local jobs by
21 spending the \$700 million on rapid deployment of
22 solar, wind and large-scale energy storage
23 region-wide. I can testify that that is what the
24 people I'm teaching in Malaysia are doing; that's
25 what the people in Singapore, that's what they're

1 doing; that's what the people in Thailand and China.
2 Asians are very competitive, as we well know, and
3 their countries are little bit ahead of ours. But
4 we can catch up.

5 Economics alone demand that we recognize
6 this reality and invest soundly in the technologies
7 of today, not the antiques of yesteryear. Thank you
8 so much.

9 EXAMINER NEWMARK: Thank you, sir.

10 (Witness excused.)

11 EXAMINER NEWMARK: Izzy Laderman.

1 IZZY LADERMAN, PUBLIC WITNESS, DULY SWORN

2 DIRECT TESTIMONIAL STATEMENT

3 BY MS. LADERMAN: Hi. Thank you for
4 holding this public hearing. My name is Izzy
5 Laderman. I am 16 years old. I am here
6 representing Friends of the Climate, a group of five
7 young women who submitted a brief to the Minnesota
8 Court of Appeals against this plant. But also
9 because I live in this area and this is my future.

10 We submitted the brief opposing the plant
11 on the basis of our finances, as it's going to cost
12 \$700 million to taxpayers, and our futures. The
13 climate crisis is here. And the fact that Wisconsin
14 decided not to consider it is wrong. This is my
15 future, my generation's future at stake; and they
16 have decided that it's not worth it to consider.

17 United Nations told us we only have ten
18 years before the climate crisis is irreversible.
19 Fossil fuels are the main contributor to the climate
20 crisis, and they want to add more? Perhaps it's
21 because the thought -- perhaps that is because
22 natural gas is seen as natural. But it's anything
23 but. Fracking ruins habitats and can cause
24 earthquakes, the transportation uses energy to get
25 energy, and the burning heats up the world. And

1 during all of this, 2.3 percent of the gas is
2 released, which is the equivalent of 70 million
3 annual tailpipe emissions. Coal releases 3 percent,
4 meaning 0.7 percent is what makes gas so much
5 better.

6 But better is not good enough. In order
7 to try and prevent the climate crisis from
8 furthering, we need to move to 100 percent
9 renewables. Renewables are cheaper and more
10 efficient. Minnesota Power says the plant is for
11 when the sun doesn't shine and when the wind doesn't
12 blow. But renewables coupled with batteries work
13 just, if not more, efficiently. This plant is not
14 needed for grid reliability. And through the
15 process of fracking, transporting and burning, you
16 use so much energy that's costing companies a lot of
17 money. With renewable energy, you don't have that.
18 So not only do you not have pollution and gas
19 emitted, it's cheaper for the companies making the
20 energy.

21 This is why the gas plant makes no sense
22 to me except that these companies are stuck in a
23 toxic tradition of fossil fuels. This issue may
24 seem small as it's just one gas plant. But
25 preventing this gas plant is huge because local

1 action adds up to global action.

2 So please help save the world, help save
3 my future. Say no to this fossil fuel and this gas
4 plant and demand renewables. Thank you.

5 EXAMINER NEWMARK: Thank you.

6 (Witness excused.)

7 EXAMINER NEWMARK: Craig Fellman.

1 CRAIG FELLMAN, PUBLIC WITNESS, DULY SWORN

2 DIRECT TESTIMONIAL STATEMENT

3 BY MR. FELLMAN: My name is Craig Fellman.
4 I'm here this evening to share my comments in full
5 support of the NTEC project. I think this project
6 between Minnesota Power and Dairyland Power is
7 absolutely critical to our region. I'm the
8 president of JAMAR Company. We're a local specialty
9 contractor that has multiple offices in Minnesota
10 and in Wisconsin. Whenever we talk about one of
11 these infrastructure projects, I will always go on
12 record of stating how important it is to a company
13 like mine, the employees of our company, the
14 families associated with our company, all of the
15 tradesmen in our region who make their living
16 through these infrastructure projects.

17 But I'm going to take a different
18 direction with my comments today because the
19 professionals, the carpenters laid out the point of
20 how important these jobs are to our region in his
21 comments earlier. So I'd like to talk a little bit
22 more about infrastructure and demand.

23 Infrastructure in our region is a problem.
24 It's weak, it's aging. The power generation
25 capacity is another example of that aging

1 infrastructure. And over the last several years,
2 the two companies that I previously mentioned, they
3 are the ones who have put in the time and the
4 investment planning for the power delivery of the
5 future for our region. They've done the most to
6 clean up coal-fired power plants, shut down
7 coal-fired power plants, and move us into the future
8 with diverse and renewable power generation.

9 Some of this was done because it was
10 mandated, some of it was driven by their
11 organizational goals. Some of it was done just
12 because it's the right thing to do for our region.
13 And that's the type of companies Dairyland Power and
14 Minnesota Power are. They have spent hundreds of
15 millions of dollars on emission controls for the
16 older fleet, improving hydro, and then moving us
17 into the new wind and solar. But now is the time
18 for us to build a clean running gas-fired power
19 plant in our region.

20 When you look back at those same years,
21 around here anyhow, Minnesota Power was in the
22 leadership role in driving improved energy
23 efficiency in our homes, in our workplaces, in the
24 plants. Nobody else took the leadership role like
25 they did. And if you're familiar with their Energy

1 Forward plan, this is the multi-front attack that
2 they're leading. Helping everyone improve energy
3 efficiency while retiring coal plants or vastly
4 improving the emissions of the coal plants,
5 increasing renewables, moving it to the target that
6 they're on track for, 50 percent by 2021,
7 diversifying the load, all while ensuring safe and
8 reliable electricity for everyone. NTEC is part of
9 this plan. Efficiency, 50 percent better emissions
10 than coal, one of these enhanced coal-fired plants.

11 So while energy users are getting more
12 efficient and Minnesota Power was the leader in
13 helping them do all this, the demand isn't going
14 away. It's just changing. Just consider data
15 storage right now. The power demand of storing data
16 in the country was like a blip on the screen 20 to
17 25 years ago. Today across the country, across the
18 U.S., the demand for data storage is approximately
19 40 times of what the Nemadji project is designed to
20 produce. Data storage demands and chews up the
21 production of almost 40 500-megawatt-hour plants.
22 So think about that the next time you post one of
23 those videos that go on Facebook. That is
24 increasing the demand. It's not ending.

25 While we're more efficient, the demand

1 will still be there. So I'd like to see this modern
2 power plant built right here with 50 percent carbon
3 emissions, 260 construction jobs, largest investment
4 in Douglas County's history. That's the modernized
5 plant that I'd like to see built right here.

6 So my main point is that power demand is
7 not going away. The power demand in our region is
8 not going to all of a sudden cut in half between
9 today and a year from now. Each household and each
10 business requires safe and reliable power delivery,
11 and nobody is going to accept anything else. NTEC
12 will be a clean, safe, reliable part of the overall
13 diversified power delivery plant for our region.

14 Thanks.

15 EXAMINER NEWMARK: Thank you, sir.

16 (Witness excused.)

17 EXAMINER NEWMARK: Looks like it's Brent
18 Fennessey.

1 BRENT FENNESSEY, PUBLIC WITNESS, DULY SWORN

2 EXAMINER NEWMARK: Can you just spell your
3 name for us. It's hard to read.

4 DIRECT TESTIMONIAL STATEMENT

5 BY MR. FENNESSEY: It's spelled
6 F-E-N-N-E-S-S-E-Y. Good evening. My name is Brent
7 Fennessey, president of the Superior City Council.
8 We've already heard some compelling points about
9 this project, why it should be improved, why it
10 should move forward. And I'm sure there's still
11 more to come. I'll let others speak on those points
12 and in greater specificity. But tonight I bring a
13 broad level of support. I bring not only my own
14 support, but also the support of the entire city
15 council.

16 On the October 15th city council meeting,
17 the Superior City Council had a resolution of
18 support for the Nemadji Trail Energy Center. Out of
19 our ten-person body, every councilor voted in favor
20 of this resolution. There are many reasons embedded
21 in that resolution that led to the unanimous
22 support. The council unanimously supported this
23 resolution specifically because the Nemadji Trail
24 Energy Center will provide the needed power when
25 renewable energy is not readily available, will

1 produce less carbon emissions compared to the
2 current traditional fuel sources, will create 260
3 family sustaining jobs during peak construction,
4 will create 25 direct jobs once fully operational.
5 The \$1 billion investment will be the largest
6 private venture not only in the City of Superior,
7 but the entire Douglas County. And, finally, the
8 City of Superior and Douglas County will share over
9 \$1 million annually in increased revenue and fees
10 for hosting the facility.

11 This bill checks all of the boxes of being
12 a valuable project, not only to Superior, but the
13 impact reaches well beyond our city limits. I fully
14 support the efforts of Minnesota Power and Dairyland
15 Electric as they seek to move forward with the build
16 of the Nemadji Trail Energy Center. I support this
17 as a Superior citizen, the Superior City Council
18 president, and your entire Superior Common Council
19 supports this project. It's projects like this that
20 build the future for Superior. So I ask that the
21 Public Service Commission of Wisconsin approve this
22 project.

23 EXAMINER NEWMARK: All right. Thank you,
24 sir.

25 (Witness excused.)

EXAMINER NEWMARK: Kathryn Hilton.

1 KATHRYN HILTON, PUBLIC WITNESS, DULY SWORN

2 DIRECT TESTIMONIAL STATEMENT

3 BY MS. HILTON: Hello. My name is Kathryn
4 Hilton. It won't take many of you all to pick up
5 the southern drawl I have. I have been a resident
6 of Superior, Wisconsin, for just under a year now.
7 Before that, I spent five years living in North
8 Dakota, three years in southwest Pennsylvania; and
9 where I originally hail from is South Carolina.

10 In my time in North Dakota and in
11 Pennsylvania, I had both the privilege and
12 misfortune of living in the shale fields in those
13 areas. In Pennsylvania they extract for gas. In
14 North Dakota they flare the gas and extract for oil.
15 These are not clean processes. So when we say clean
16 burning natural gas, that is rhetoric that companies
17 give to you to blind you to the reality. I have
18 many friends who are sick, who have children who are
19 sick, who live in these extraction zones; and that
20 is the type of pollution that we will continue to
21 bring to our area if we allow this project to go
22 forward.

23 There's always this talk of jobs, and I
24 heard the outstanding number of 25 permanent jobs.
25 Well -- and then there's also the fact that

1 renewables aren't here yet. Well, if we would build
2 renewables here instead, then we could put those 25
3 jobs in that sector plus all the construction jobs
4 to make that infrastructure work. So to rely on
5 this project that is not yet approved to sway us to
6 think it's the only solution is a mistake. And I
7 know there was an event here where the Superior
8 refinery, there was an incident. These happen all
9 of the time. It will not be excluded from the
10 possibility of happening with this plant if it is
11 constructed. Human error and mechanical failure are
12 inevitables, period. Every day, every single day
13 people are put in harm's way, workers, residents,
14 children, elderly. There's no escape from it if we
15 continue to go down the road with fossil fuels.
16 That's my comment.

17 EXAMINER NEWMARK: All right. Thank you,
18 ma'am.

19 (Witness excused.)

20 EXAMINER NEWMARK: Dan Olson.

1 DAN OLSON, PUBLIC WITNESS, DULY SWORN

2 DIRECT TESTIMONIAL STATEMENT

3 BY MR. OLSON: My name is Dan Olson. I'm
4 a lifelong resident of Superior, south Superior. I
5 live about a mile and a half from where this
6 proposed project is looking to be built. In that
7 area there's also Husky Refinery, Enbridge Energy.

8 And I just want to bring up a few points
9 that the importance of these projects is important
10 to every single one in this room. The thoughts and
11 the process that everybody brings forward, their
12 suggestions as to either support or not support are
13 as important, every single one of them is equal
14 across the board in importance.

15 I think what also is important is that
16 renewables are something that should be a goal that
17 we all are looking for. I can tell you that across
18 the United States right now, the energy sector is
19 one that's been used for 30 to 40 years, sometimes
20 longer. The east coast has relied on nuclear for
21 many, many years. The belt in the middle of the
22 United States, what you see over in Duluth right
23 now, all the wind turbines, they're going to South
24 Dakota because that's where the wind vane is. And
25 west coast California, Oregon, Washington, primarily

1 solar.

2 So we are not going to get away from
3 fossil fuels in the immediate future. I think the
4 goal is to make everything as best that we can,
5 strive for everything that we can, make this project
6 or any other project that anybody is trying to
7 support the safest with the most skilled people in
8 this community and the surrounding areas. I think
9 that Mr. Fennessey, our president of the city
10 council, brought a real good point up that it's hard
11 to get -- I'm on the city council -- it is hard to
12 get ten of us to agree on anything, let alone the
13 hundred people that are in this room. I realize
14 that. But the support that we have, the support in
15 the community, I've lived on the south end all my
16 life; and moving forward with renewable energy is
17 nothing more today than a start. And we have great
18 partners that we all rely on, whether it's Minnesota
19 Power, Superior Water and Light, Dairyland Power,
20 the regulatory people, the Administrative Law Judge
21 who this is going to be in their hands to decide
22 what we are looking at here, what we're supporting
23 or not supporting, those are very important things.
24 And we need to rely on the people that are the
25 experts in that field. So if there's a watershed

1 issue, it needs to be addressed. If there is a
2 fossil fuel issue, it needs to be addressed. Just
3 like any other projects that we bring forward.
4 Whether it's at the city council level, whether it's
5 at Douglas County, whether it's the State of
6 Wisconsin, whether it's my brothers and sisters in
7 the audience today from the building and trades.

8 We are nothing more than a conduit, the
9 before the building and tradespeople, to assure this
10 project is built proper. That is why we support a
11 project labor agreement. We also supported a
12 project labor agreement at the Douglas County level,
13 Keith, for the same project. So there's support in
14 numbers, there's support in research. But moving
15 forward, this is a project that will give us power
16 on demand. Because everyone in this room needs
17 power when they demand it. Example, how many people
18 got a cellphone in their pocket, right? You all
19 powered it up on demand because you wanted to use it
20 tonight. Okay?

21 I support this project 100 percent. And
22 if there's anything that anybody in this community
23 can do, we're here to answer any questions or be a
24 part of this project. Thank you.

25 EXAMINER NEWMARK: All right. Thank you,

1 sir.

2 (Witness excused.)

3 EXAMINER NEWMARK: Okay. Brian Hanson.

1 BRIAN HANSON, PUBLIC WITNESS, DULY SWORN

2 DIRECT TESTIMONIAL STATEMENT

3 BY MR. HANSON: All right. Good evening.
4 My name is Brian Hanson. I've lived in the Twin
5 Ports for the last 30 years. I'll slow down, sorry.
6 I'm proud to serve over 90 employers and tens of
7 thousands of working men and women in this region as
8 the CEO of APEX, a private sector led business and
9 economic development organization. I'm here today
10 to urge you to rule in favor of the partner's
11 petition for a certificate of public convenience and
12 necessity for the NTEC power plant. And I'll tell
13 you a little bit about why.

14 So I work every day trying to drive
15 investment in this region. With the project price
16 tag of \$700 million and an estimated annual tax bill
17 of \$1 million in this region, this project certainly
18 drives investment. But it also does so much more by
19 adding reliability and balance to our regional power
20 supply grid.

21 In my position at APEX, I work supporting
22 both existing companies and new companies to help
23 them grow. Energy reliability is a key issue.
24 Regional employers cannot grow unless we can
25 demonstrate that we have a reliable energy mix.

1 This is especially important for our region's
2 growing tech sector.

3 Now, let's turn to the weather for a
4 second and just think of the turmoil we all
5 experience when severe weather strikes our system.
6 I can't imagine setting up our region for this
7 potential every day simply because we turn our backs
8 on a balanced, reliable energy supply provided by
9 projects like NTEC. Consumers and businesses alike
10 demand it, and they should. We need reliability and
11 we need NTEC.

12 Sustainable energy sourcing is also very
13 important in our community. The NTEC will meet
14 multiple goals in this area, adding natural gas
15 fueling to a very small existing gas portfolio here,
16 reducing carbon intensity while providing an instant
17 backup. This project supports the ever-expanding
18 fleet of wind and solar being added for days
19 you-know-what. Sorry. So this state-of-the-art
20 technology to be used in this modern facility is
21 dispatchable. That means it can be both brought
22 online quickly and also slowed down and stopped
23 quickly, supporting maximized use of renewables.

24 Some would say energy use is declining,
25 that demographics don't -- the demographics don't

1 support growth here and we don't need this plant. I
2 wholeheartedly disagree. Our region has the
3 potential to grow. And we're on the right track.
4 We have the people, the natural resources and the
5 entrepreneurial spirit. We need reasonably priced,
6 highly reliable energy infrastructure to support
7 growth. We need NTEC.

8 Finally the folks we turn to for 24/7
9 reliability that we all pretty much enjoy here where
10 we live tell us -- are telling us that they need
11 this project. They're the ones who have the
12 daunting job of dealing with weather, power demand
13 spikes, growing demand and balancing an
14 interconnected supply throughout this entire upper
15 midwest, not just the one home where batteries can
16 maybe help, but the entire upper midwest. They know
17 that we need this project. Their need is our need.
18 We need NTEC.

19 I hope we choose to work together to
20 support clean and reliable energy generation for the
21 great states of Minnesota and Wisconsin by
22 supporting this certificate of public convenience
23 and necessity. Thank you.

24 EXAMINER NEWMARK: Okay. Thanks, sir.

25 (Witness excused.)

1 EXAMINER NEWMARK: I have two more slips
2 for people who want to speak. Max Carl and
3 Mr. Robert Owen, Junior. So anyone else who wants
4 to speak, get a form filled out, check yes in the
5 box where it says speak now, and bring it to
6 Commission staff. They'll get it to me. So we'll
7 be able to take these last two and then we'll break
8 for a little, see if people want to regroup and
9 decide they want to speak, feel free to do that.
10 But at this point I'll call Max Carl.

1 MAX CARL, PUBLIC WITNESS, DULY SWORN

2 DIRECT TESTIMONIAL STATEMENT

3 BY MR. CARL: Thank you for letting me
4 speak here tonight on this very critical issue.
5 This was a great idea back in 1985, back in 1975.
6 It's too late now. Far too late. We have too much
7 carbon in the atmosphere right now. And even -- no
8 matter how efficient you are, you're certainly
9 loading more carbon into that atmosphere by burning
10 fossil fuels.

11 We live next to this big lake that we all
12 love. That lake is the fastest warming lake in the
13 world. It is -- the average temperature of that
14 lake has increased four degrees. Most of the carbon
15 loading in the oceans and most of the heat stored in
16 the water of the oceans and Lake Superior has
17 occurred in the last 25 years.

18 Efficiency is not going to save us. Not
19 burning fossil fuels is a start. Now, we all
20 remember the big rainfall here in Duluth back in
21 2012, 12 or 13 inches of rain. We remember the
22 damage from that, the chaos from that. We remember
23 the big rain we had over in Saxon Harbor that was in
24 2016. That completely washed the entire marina out
25 into Lake Superior. We remember the flood of 2018

1 that tore out the Radigan Dam and flooded the roads
2 so that a lot of people that left for a couple days,
3 they couldn't get back to Duluth. This is because
4 there's so much water in the atmosphere because the
5 atmosphere is warming up, warms up the water, the
6 water comes off the equator and it pushes up this
7 far.

8 We're not in as bad of shape as
9 California. California is burning again. People
10 are fleeing for their lives. They've got -- it's
11 like a crown fire out there, there's so much wind
12 associated with the heat from these fires, people
13 can't away from them lots of times. The same thing
14 happened in Australia. By the time the people heard
15 the sound of the fire, it was too late. There was
16 no way they could get away. The fire advanced at,
17 like, 60 miles an hour.

18 We're lucky up here because we're just
19 going to get lots and lots of rain. It's going to
20 cripple our townships, it already has. We don't
21 have the money in our townships to fix our roads.
22 Who's going to pay for that? The taxpayer is going
23 to pay for that, you know.

24 So that's the situation we're in. And
25 I -- it's not something people like to talk about.

1 They don't want to hear about it. They're in denial
2 about carbon in the atmosphere. But we're all going
3 to suffer. And friends of mine who were in Florida
4 after Hurricane Maria, and they were right on the
5 coast, they only had a two-foot surge there from the
6 ocean, from the Gulf of Mexico. But they had three
7 30-inch rains there in that year, and there was so
8 much water coming off the state that the ocean side
9 of the cities on the west coast of Florida had a
10 couple feet of water, but six miles inland they had
11 12 feet of water because the rain's gotta go
12 somewhere. That's a lot of rain. Houston was 54
13 inches of rain they got. Now, we're dealing with 12
14 and 13 inches. How is it going to be when it's 18
15 inches at a time, 18 inches over four or five hours?
16 It's just a question I put before you, and I thank
17 you for the time to say this and the audience, and
18 thanks for listening.

19 EXAMINER NEWMARK: All right. Thank you,
20 sir. Okay.

21 (Witness excused.)

22 EXAMINER NEWMARK: The last form I have is
23 from Mr. Owen. We can go off the record.

24 (Discussion off the record.)

25 EXAMINER NEWMARK: Let's get back on the

record for Mr. Owen.

1 ROBERT OWEN, JR., PUBLIC WITNESS, DULY SWORN

2 DIRECT TESTIMONIAL STATEMENT

3 BY MR. OWEN: Good evening. My name is
4 Robert Owen, Junior. I'm a resident of Middleton,
5 Wisconsin, I own property in rural Bayfield County,
6 and I'm a grid-tied solar owner and member of
7 Bayfield Electric Cooperative. I am -- as I tried
8 to say, but too quiet, I am a solar owner and member
9 of Bayfield Electric Cooperative in Bayfield County.
10 I'm testifying today in favor of constructing and
11 operating the Nemadji Trail Energy Center as a 100
12 percent renewable energy fuel peaking facility. So
13 I'm differing with the applicants here on the choice
14 of fuel for this facility, but not the desirability
15 of having such a facility.

16 I think we can do it with renewable energy
17 and we can solve both problems that people are
18 talking about tonight. One being greenhouse gases,
19 the other being reliable electricity when the wind
20 and solar inputs to our electric system fluctuate so
21 much and, of course, our loads fluctuate as well.

22 But I am definitely here to join with
23 those previous witnesses who have said that we
24 urgently need to stop burning fossil fuels. This is
25 a really serious business, folks. It could destroy

1 our climate for our descendants. It could destroy
2 it for ourselves. We're already seeing the
3 beginnings of very serious climate destruction. And
4 I think there's a lot of awareness amongst the
5 people here in this room of this. We've seen it in
6 the form of heavy rain events mostly. But some of
7 us who have been to the west coast may have seen
8 other manifestations of it. Unfortunately,
9 apparently neither Minnesota Power nor Dairyland
10 Power Cooperative read the climate change memo; and
11 everybody received it, but some chose not to read
12 it. And they are accountable for failing to heed
13 that memo. And the Wisconsin Public Service
14 Commission is also accountable for its own failure
15 to heed climate science.

16 On the legal front in this case, the PSC
17 has erred in its preliminary determinations in this
18 case that it lacks authority to consider greenhouse
19 gas emissions associated with NTEC by virtue of
20 Section 196.491(3)(d)(3) and (4) of Wisconsin
21 Statutes, and that NTEC is a wholesale merchant
22 facility under Section 196.491(1)(w)(1) Wisconsin
23 Statutes. As a result of these errors, the PSC has
24 inappropriately limited the scope of the hearing.

25 The PSC has limited consideration of

1 greenhouse gas emissions at the proposed power
2 plant. That's a big mistake. Both CO2 and methane
3 emissions contribute to global climate chaos. But
4 CO2 emissions do something else that we should
5 consider closely in the case of this facility. They
6 also acidify Lake Superior. And everybody in this
7 room is concerned about Lake Superior. It's a
8 global treasure, it's a particular treasure for this
9 region. It's also a poorly buffered lake with a
10 relatively small drainage area beyond the surface of
11 the lake itself and, therefore, it is highly
12 vulnerable to acidification. And what happens when
13 you emit CO2 to the atmosphere in Superior and the
14 wind is blowing from the southwest? It blows out
15 over the lake and that CO2 interacts with the cold
16 water of the lake and it forms carbonic acid which
17 acidifies the lake. That's a global problem, but
18 it's particularly a problem here. It's a problem
19 that needs to be studied and it's a problem that the
20 PSC is permitted to look at under Wisconsin law
21 because it's a water pollution problem. CO2 is an
22 air pollution problem, it's also a water pollution
23 problem. We cannot forget that.

24 We -- but returning to air pollution. We
25 know the effects of CO2 and CH4 emissions on the

1 earth's atmospheric temperature regulation system
2 are utterly disastrous. The resulting extreme
3 weather disrupts ecological balance in all kinds of
4 systems on a planetary scale.

5 The PSC needs to take a hard look at the
6 full greenhouse gas emissions associated with NTEC.
7 It is highly appropriate to truncate consideration
8 of greenhouse gas emissions in this case. But the
9 PSC should go further and correct its legal errors.
10 It should notice and hold a new hearing; and it
11 should address issues of cost, economics and system
12 alternatives to NTEC.

13 System alternatives to NTEC on the future
14 largely wind and solar energy grid include
15 aggregated distributed and utility scale battery
16 energy storage. Other utilities and commissions
17 around the country are increasingly finding that
18 batteries are a better near-term solution to
19 fluctuating wind and solar energy output than
20 building a new natural gas combined-cycle power
21 plant.

22 Batteries are cheaper than increasing
23 reliance on natural gas fueled NGCC plants. But you
24 won't notice that, PSC, if you don't even look.
25 Wisconsin consumers are already paying higher rates

1 than electric consumers in many other states because
2 this agency did not anticipate the economic folly of
3 investing in some of the last coal-fired power
4 plants built in this country. And that was about 16
5 years ago. It's expensive for both utility
6 ratepayers and cooperative members for the PSC to
7 hire ostriches as energy utility regulators.

8 Don't make the same mistake with regard to
9 fracked gas-fueled NGCC plants, PSC. Don't
10 authorize Dairyland and Minnesota Power-Superior
11 Water, Light and Power to build another fossil fuel
12 asset which would be a stranded asset before it even
13 is completed. Don't be fossil fuel fools again.
14 The looming physical threat of climate change is
15 matched by the looming economic threat of carbon
16 taxation. And that is also a threat impacted by
17 this plant. The enactment of a federal carbon tax
18 could come as early as 2021.

19 There is a bill in the hopper in the U.S.
20 Congress right now, it's House Resolution 763, that
21 proposes a carbon tax. If and when such a carbon
22 tax or some other version of a carbon tax does go
23 into effect, the cheap natural gas on which
24 applicants relied and justify NTEC in their own
25 economic calculations will instantly disappear. And

1 NTEC will become uneconomic to run except as a
2 super-peaking plant when grid power costs spike very
3 high. NTEC will be run each -- less each year
4 thereafter because the carbon taxes will ratchet
5 upward. And therefore NTEC fixed costs will be
6 spread over fewer and fewer kilowatt-hours of
7 generation, consumers will groan under the economic
8 burden of paying for another utility mistake.

9 But consumers will not just take it this
10 time. They'll remember who decided not to consider
11 climate change and the prospect of carbon taxation
12 before NTEC was built. They'll support municipal
13 utility takeover campaigns in Superior and Duluth.
14 They'll defect in droves from the rural electric
15 grid of Dairyland Power Cooperative.

16 I'm a solar owner. I have that option, if
17 Dairyland goes so far as to build this plant, I'll
18 exercise that option. And I'll have a lot of
19 company because solar is really cheap and grid-tied
20 rural electric cooperatives, at least cooperatives
21 as rural as Bayfield Electric, have very high
22 connection costs. It costs nearly \$40 a month just
23 to be connected to Bayfield Electric even if you're
24 supplying your own electricity from your solar
25 panels, which is pretty much the case for my

1 property.

2 That situation does not put Dairyland and
3 its member cooperatives in a very comfortable
4 position if this plant gets in a situation where
5 carbon taxes are imposed and its economics are
6 totally destroyed. That's going to put enormous
7 pressure on the cooperatives to raise certain rates
8 which will in turn encourage people who are in the
9 position to own solar systems on their rural
10 properties to defect from the co-op, which will
11 leave those fixed costs on fewer members of the
12 co-op which will cause the co-op to raise the rates
13 again. It's a very dangerous, destructive cycle
14 that can occur in that type of situation. So this
15 is a risky thing for Dairyland to do, it's a risky
16 thing for its member cooperatives, it's something
17 that I would encourage them to think very long and
18 hard about before they do it.

19 In addition to remembering the names of
20 the ostrich -- remembering the names of the
21 utilities that made bad decisions that resulted in
22 this plant, the consumers who are affected are going
23 to remember the names of the ostriches of the Public
24 Service Commission who approved it as a fossil fuel
25 plant. And they're not going to remember them in a

1 positive way. And they're probably going to be
2 voting against the party that -- or the governor who
3 appointed them, and they're probably going to be
4 voting out the cooperative directors who approved
5 their cooperative's participation in this project.

6 It basically gets down to the fact that
7 there have been a lot of blunders made in the energy
8 policy in recent years, and we are paying for them
9 all. And we're getting tired of it. So my thought
10 is why not consider making a better decision in this
11 case. Consider the environmental factors associated
12 with the greenhouse gas emissions, consider the
13 risks of carbon taxation, and opt right now, not
14 five years from now, right now to choose a renewable
15 fuel for this plant.

16 This plant has some economic and
17 engineering logic behind it. It is true that solar
18 and wind energy are highly variable in their output
19 and there are times when they don't produce enough
20 to keep the lights on. Most of the time batteries
21 will pick up that load. But there are times, like
22 those two-week periods in November and December of
23 some years, we don't see the sun. Maybe a week of
24 which is also accompanied by doldrums where there
25 isn't much wind. There are periods like that when a

1 system without such a facility isn't going to do the
2 job even if we have a lot of batteries because the
3 batteries are going to be exhausted. And so NTEC
4 makes sense. But NTEC makes sense as a renewable
5 fuel plant, and I'd like to talk a little bit about
6 how we can do that.

7 The greater Twin Ports region has the
8 ability to produce renewable methane by sustainable
9 means. And biomass resources that could produce
10 methane include surplus hay from St. Louis, Carlton,
11 Pine, Ashland, Bayfield and Douglas Counties, all of
12 which have a lot of grass clippings; food wastes
13 from the Superior-Duluth Metro Area; grass clippings
14 from town and county roads and highway maintenance
15 in the region that would include also interstate
16 highways in the region; biogas from dairy farm
17 anaerobic digesters; and gas from anaerobic
18 digesters at Superior and Duluth wastewater plants.
19 All of these types of sources could be used to
20 produce renewable methane.

21 The biogas produced by digestion of such
22 biomass can be cleaned, upgraded and compressed to
23 produce pipeline quality renewable natural gas.
24 Renewable natural gas can be burned in unmodified
25 NGCC plants. The same plant that is being proposed

1 in this proceeding can burn renewable methane. It
2 doesn't have to have a fossil fuel.

3 In addition to producing renewable methane
4 from biomass, the greater Twin Ports region could
5 support renewable methane production from CO2,
6 water, and temporary surplus wind or solar energy in
7 something known as the power-to-gas process. CO2
8 sources in the region could include wastewater
9 plants in Duluth and Superior, the Duluth District
10 Heating Plant, the Bay Front wood burning power
11 plant in Ashland, the paper mill in Duluth, new
12 anaerobic digesters processing hay, grass and food
13 waste, the Husky Oil Superior Refinery until the
14 carbon taxes shut it down, the fossil fuel power
15 plants in the region until carbon taxes force them
16 to close, and even CO2 removal from the atmosphere.
17 There are processes and devices that have been
18 developed that do remove CO2 from the atmosphere;
19 and we will need to use them, folks, because
20 otherwise we're going to fry, we're going to cook,
21 we're going to burn and we're going to drown.

22 Turning captured CO2 into methane using
23 surplus power and water is a proven technology used
24 at megawatt-scale in Europe for years. This
25 technology solves two problems for power suppliers.

1 It uses temporary surplus wind and solar energy, and
2 we're going to have a lot of that when we're mostly
3 wind and solar energy delivered on our power grid.
4 And it also stores the energy that's captured in a
5 manner that we can use it later. Methane is an
6 ideal form to do that. It is -- we can use it in
7 our existing power plants, we can use it in our
8 existing natural gas pipelines, in our existing
9 natural gas storage facilities. And we can store
10 natural gas or renewable natural gas seasonally.

11 If we could co-locate renewable methane
12 production with NTEC and cross-train the plant
13 staff, those 25 people that were discussed earlier,
14 we could make renewable methane at that location
15 when wind and solar energy production and battery
16 storage permit, and we could burn renewable methane
17 and operate the NTEC power plant when grid
18 conditions require. And renewable methane is an
19 ideal fuel to balance fluctuating solar and wind
20 input against variable electric load on time scales
21 of more than a few hours or a few days when
22 batteries tend to be --

23 MALE SPEAKER: Point of order. Let's get
24 back to the subject instead of beating around the
25 bush.

1 EXAMINER NEWMARK: Off the record.

2 (Discussion off the record.)

3 EXAMINER NEWMARK: On the record, please.

4 MR. OLSON: Thank you, Judge Newmark.

5 Resuming, NTEC would work fine as a facility -- as a
6 peaking facility if it would burn renewable methane
7 instead of natural gas. It would not require any
8 modification. Switching fuels to renewable methane
9 would be an advantage for all utilities involved.
10 Renewable methane would be cheaper than carbon taxed
11 natural gas. This switch would also be popular for
12 its environmental advantages, and it would create
13 local jobs, including construction jobs installing
14 digesters, gas cleanup facilities, CO2 capture
15 facilities, compressors, pipelines, et cetera, in
16 addition to NTEC itself. So it would create more
17 jobs than NTEC. And it would also create more
18 operating jobs than NTEC.

19 The PSC could restore its reputation for
20 regulatory excellence from decades past. The
21 utilities could restore their reputation as entities
22 that care for the community and the environment
23 which they have occasionally enjoyed. And everyone
24 would benefit. And, of course, CO2 and CH4
25 emissions would drop. So if we do this in the case

1 of NTEC by switching it to renewable methane right
2 from the get-go, everyone comes out ahead. I urge
3 the PSC to do just that. Approve NTEC conditioned
4 on the use of a 100 percent renewable energy supply.

5 EXAMINER NEWMARK: Thank you, sir.

6 (Witness excused.)

7 (Recess taken from 8:05 to 8:26 p.m.)

8 EXAMINER NEWMARK: Nicolette Slagle.

1 NICOLETTE SLAGLE, PUBLIC WITNESS, DULY SWORN

2 DIRECT TESTIMONIAL STATEMENT

3 BY MS SLAGLE: Hello, my name is Nicolette
4 Slagle. I'm a resident of Duluth, Minnesota. And
5 I'm here to speak in opposition to this planned gas
6 powered plant. I have a few different points that
7 I'm going to go through tonight. The first point
8 is, as many folks have touched on throughout the
9 night, is that we are in a critical time for our
10 climate and for our planet and we need to transition
11 swiftly to non-damaging sources of fuel.

12 Now, this transition is going to take a
13 complete retooling of our infrastructure and the way
14 that we do business. And this transition, of
15 course, all of this retooling that's going to have
16 to happen, including investments in public
17 transportation to reduce the number of vehicles on
18 the roads, upgrades to our energy efficiency,
19 upgrades to our insulation in our buildings and our
20 homes, all of this needs jobs. So the argument that
21 this plant is needed for jobs is a false argument.

22 The next point that I'd like to bring up
23 is this question of technology. And we know that
24 the technology of wind and solar is out there and
25 that it's dropping in price daily and has now become

1 more competitive than coal and other polluting fuel
2 sources.

3 The other technology that is already out
4 there that we don't have to wait for is large
5 battery storage. New York City actually just
6 recently voted to move forward on a 316 megawatt
7 battery storage plant to remove two gas-fired power
8 plants. If this is something that can handle the
9 loads and demands of New York City, why can't
10 something similar be implemented in this region?

11 Which brings me to my next point. We're
12 at a meeting of the Public Service Commission, so
13 I'm asking in what sense is this project a public
14 service? As far as I know, the need for this plant
15 isn't dictated by homeowners' needs for charging
16 their cellphones or heating their homes or different
17 uses like that. It's needed because of the large
18 industrial consumers whose loads are going to be
19 increasing in the next few years, such as Enbridge,
20 their pipeline system, and the Husky refining plant.
21 So if that's really where this energy is going to,
22 how is that something that's in the public need?

23 Another question that I'd like to bring up
24 that's been brought up by the Red Cliff Band is the
25 rights of the wetlands and the watersheds that this

1 plant will deeply impact. On their website, it says
2 that this plant will use 2.9 million gallons of
3 water per day when it's under operation. 80 percent
4 of this water will dissipate into the environment
5 and the rest will be fed through Superior's
6 municipal wastewater treatment plant. This impact
7 on the wetlands and the aquatic ecosystems in this
8 area can have a very detrimental impact, in addition
9 to the fact that they're moving this water from the
10 groundwater into the air, and you know that this
11 region is already suffering from unusually high
12 water rainfalls.

13 Additionally, the Husky plant is now also
14 planning to put their wastewater through Superior's
15 municipal wastewater treatment facility. Now, often
16 wastewater -- municipal wastewater treatment
17 facilities end up taking industrial wastewater. But
18 often these plants are not actually set up or
19 equipped to deal with these kind of industrial
20 loads, and there ends up being pollution coming
21 through the end of these wastewater treatment
22 systems that are either not regulated or not tested
23 for, so we don't actually have a clear picture of
24 what's coming through these facilities.

25 And, finally, the last thing that I'd like

1 to touch on and somebody touched on earlier is that
2 there is no way that this can be considered a clean
3 source of fuel. All you have to look at is the
4 impacts that fracking is having on these communities
5 and you know that this is not something that is a
6 good future for our planet or for this region.
7 Thank you.

8 EXAMINER NEWMARK: All right. Thank you.

9 (Witness excused.)

10 EXAMINER NEWMARK: All right. Our final
11 appearance slip, Nookomis is the name I have here.
12 Here she is.

1 NOOKOMIS AADOPOWIN, PUBLIC WITNESS, DULY SWORN

2 DIRECT TESTIMONIAL STATEMENT

3 BY MS. AADOPOWIN: Boozhoo. Nookomis.
4 I'm from Anishinaabe Nagaiwanang. My family has
5 been here for 12 generations. I think one of the
6 most important things that this Minnesota Power is
7 missing out on, missing the big picture here, is the
8 treaty of 1854, treaty of 1826, 1837. Yeah. So
9 maybe we should have some tribal consultation with
10 the sovereign nation before we move forth. So
11 that's just one of the things.

12 Also, the higher fee for residents. I
13 know I'm pretty cheap. You know, I'm going around
14 and I'm unplugging everything; and it really
15 bothered my husband the first 30 years, but now he's
16 getting used to it, having to plug in the microwave
17 or the coffee pot or things like that.

18 So with that being said, I've read all of
19 the paperwork that has said that regardless of all
20 of this, like Nicolette has said, that this is
21 coming -- stemming from getting ready for the
22 pipeline to come through, right? And who's going to
23 have to foot that bill is us, and all of the elders
24 who are on social security, all of the people who
25 are on fixed incomes, it's coming out of your

1 pockets, out of your mouths, you know. Because
2 you're going to have to pay this bill or eat food,
3 right?

4 So 25 permanent jobs. There was
5 approximately 200 people in this room. In this
6 little corner right here there were about 30, 30
7 people sitting down. So out of all of these 200
8 people in this room, only 30 of those people are
9 going to have a permanent job while everybody else
10 is going to be looking in the window hoping that you
11 get to at least pay the electric bill, hm?

12 9.2 -- what was that, 9.2 million gallons?

13 MS. SLAGLE: 2.9.

14 MS. AADOPOWIN: 2.9 million gallons of
15 clean, fresh, unadulterated water that they're going
16 to be using every single day. How much is that?
17 2.9 million gallons of fresh water every single day.
18 How much do you use every single day? Do you know?
19 You know, every time you flush the toilet, maybe --
20 what is that, three gallons or maybe is it a gallon
21 and a half? You know, so what do we use, maybe 20
22 gallons a day? I don't know. I don't. Does that
23 sound about right?

24 So 2.9 million gallons of fresh, clean
25 water they're going to be using, taking out of your

1 children, out of your mouths, right? Because as we
2 know, as we've read, Ashland is already since, what,
3 2012 already putting their raw sewage into the lake
4 after any rainstorm, as does Duluth. I haven't read
5 anything specifically saying Superior, but how many
6 others do, right, that put in -- their raw sewage
7 into Lake Superior already. So that's already
8 poisoned water that we can't use.

9 And, again, 2.9 million gallons of water a
10 day that they're going to be poisoning. Which leads
11 up to the next question is how many gallons of water
12 is in Lake Superior? Do we know that answer,
13 Nicolette? A whole bunch. More than 2.9 million?
14 How long can this withhold us, 2.9 million, how
15 many -- do we know that question? Is there anybody
16 in here that can kind of whip out their phone and do
17 some math quick fast and in a hurry? No? Okay.
18 Anyways, I'll move along, sorry.

19 So what happens when they no longer need
20 this plant or this building or whatever, who's going
21 to be responsible for cleaning it up? And who's
22 going to be responsible for cleaning up that water?
23 Is this a question -- I mean, I don't get an answer
24 to these questions?

25 EXAMINER NEWMARK: Let's go off the

1 record.

2 (Discussion off the record.)

3 EXAMINER NEWMARK: We can get back on.

4 MS. AADOOPOWIN: And how much does a
5 permit cost? Do we know that answer? Do we have
6 any answers to that? Do we have variances?
7 Remember there's variances to poisoning our water.
8 Who even knew that there was such a thing?

9 So I think that's kind of what I came to
10 say is no means no. You know, when a woman says it,
11 you're supposed to stop. So my mother, the earth,
12 is saying no. So stop. Miigwech.

13 EXAMINER NEWMARK: Thank you, ma'am.

14 (Witness excused.)

1 RENE ANN GOODRICH, PUBLIC WITNESS, DULY SWORN

2 DIRECT TESTIMONIAL STATEMENT

3 BY MS. GOODRICH: Hi. Boozhoo. (A
4 statement was expressed in native language). My
5 name is Rene Ann Goodrich, R-E-N-E, A-N-N, Goodrich.
6 I'm a tribal member of the Bad River Band of
7 Chippewa Lake Superior Ojibwa. I'm a grandmother
8 and educator, an advocate and a citizen of -- I live
9 right here in Superior.

10 So it's great to see all of you. You're
11 all my neighbors. A property owner, I'm on the
12 north side. I have a small business there. It's a
13 restored historical home. So I understand the high
14 cost and the energy that's involved and how
15 expensive it is. So I got that. I wanted to say
16 thank you so much for this opportunity to share some
17 of my immediate concerns and also to say thank you
18 for helping me learn the process and for the
19 inclusion, and the inclusion piece is huge.

20 I was able to learn a lot from our city
21 council that was here. They shared their support.
22 I got that. Also with our local union, I understand
23 their support and where they're coming from because
24 Superior does need jobs, we need jobs here.

25 Better -- my observation, I would like to

1 add is that money better spent, we want those jobs,
2 we want our local union guys, we want them working,
3 we want the employment so that we're able to raise
4 our families. But let's not cut our employees and
5 our workers short and our communities short. Let's
6 invest in them. With this exorbitant amount of
7 moneys that we have here that's going to be invested
8 into this project, let's invest into our workforce
9 and provide them with this awesome training that
10 they could possibly obtain, something that they
11 could put underneath their belt per se and help to
12 move them forward into a greener economy and provide
13 them with the training in solar. We did listen to
14 some consultants that said that they could offer
15 training to our local community members and our
16 local unions, so that would be money better spent.

17 My concern, another concern I had was the
18 Environmental Impact Statement and the process there
19 is if tribal members were involved, if they were
20 notified and if they were able to have input of
21 their concerns regarding the environmental impact
22 that this project would bring. This particular area
23 is an 1854 treaty. There's three tribal --
24 federally recognized tribal members in Minnesota,
25 and there's multiple tribal tribes here in

1 Wisconsin. And after I asked, there was only three,
2 maybe two or three that were notified. And I'm not
3 sure -- I wanted to ask if you would please
4 reconsider that and have that put into the notes
5 that the vested tribal members that have a vested
6 interest in this project, whether they live a mile
7 away or two miles away, as a tribal member, and this
8 is ceded territory of 1854, that all of those tribal
9 members of all of those multiple tribes in Minnesota
10 and Wisconsin have a vested interest.

11 So I wanted to ask that be included in the
12 notes is that they were not notified. So I have
13 some concern about that, is that individual tribes
14 were not notified and they were not able to
15 contribute to the impact statement.

16 Also asking for the -- please reconsider
17 about the two Wisconsin Statutes that were quoted
18 earlier with the idea that was shared about the
19 possible use of renewable energy to help with this
20 project. That was a great idea. Thank you so much
21 for sharing that.

22 And then thirdly would be how feasible is
23 this project for local communities, members, job
24 seekers, property owners, families raising their
25 children, many of us sitting in here that are left

1 sitting in this room, I mean how feasible is this
2 for us? And what is our long-term consequences to
3 our water? We have grave consequences that can
4 occur with this type of fracking being so close to
5 Lake Superior, and there is a reason why we don't
6 have fracking in this area. So I wanted to put that
7 out there, to please consider the economical
8 feasibility of these new carbon taxes, how feasible
9 is that? And our investments being abandoned in the
10 very short future. We're not investing, then we're
11 left with the burden. And who is going to pay for
12 that? Taxpayers are going to pay for that. Mothers
13 are going to pay for that, fathers, grandmothers,
14 homeowners, we're the ones that are going to be left
15 with this burden. And what future are we building
16 for our grandchildren if we are left with the burden
17 of our water being polluted?

18 I mean, so really I'm asking to please
19 consider these important facts and consider why
20 weren't tribal members that have a vested interest
21 in this project, why were they not contacted and
22 included in the Environmental Impact Statement. And
23 I want to say thank you, thank you to my neighbors
24 and thank the relatives here in Superior. Miigwech.

25 EXAMINER NEWMARK: Thank you, ma'am.

1 (Witness excused.)

2 EXAMINER NEWMARK: All right. Anybody
3 else? No? All right. Well, hearing that, thanks,
4 everybody, for participating, for your thoughtful
5 comments and intelligent comments. Thank you for
6 listening most of all. I think we learned a lot and
7 we were able to share a lot of different views in
8 true Wisconsin fashion. So I appreciate it very
9 much.

10 So we will be back at 10 a.m. for the
11 party session, the public is welcome to observe
12 that, and then 2 p.m. again for more public
13 comments. Take care.

14 (The hearing concluded at 8:49 p.m.)
